Problem Statement: Wealth management fund, onboarding of new clients is slow. We want AI to increase speed in the workflow of the onboarding.

Assumptions: Workflow: get money from clients,invest it in classes.
Usual employee workflow: work with the client, get their documents, cross reference them with banks, sign and agree, new client.

Stakeholders: Employees of the company. Management of the company. Client of the company. Banks involved in the workflow.

Infrastructure and flow:

Agent workflow.
Input: platform to input the basic necessary documents needed for the onboarding. When the input gets submitted, a welcome email is sent to the customer (supposing that the email is inserted in the platform). If there are missing documents, still proceed but will get back to the client later on the agent side.

Send mail -> Gmail.

Status: starting, document check, bank waiting - bank accepted/check needed.

Agent. Prem models, with encryption.
MCP server connected toward GMAIL, EXCEL….

RAG system, get documents on client and reason on them.

Objective:
Bank Statement,
Tax statement,
Invest. Portfolio

LLM check - they are sent to bank.

Status: waiting for bank feedback

Update - goes well - email update.
Goes wrong: agent missed info or there are new info needed.
Human in the loop.

Updates the status.

Evaluation:

Let the agent run in shadow mode for a period, checking performances.
Customer onboarded/month -> workflow completed.

How much time until documents are checked.

Does the AI get all info from the documents? Golden dataset with the employee.

SLA:
Downtime: 99.5,99.7 uptime. Where downtime would be fixable just resorting to the usual workflow.
Load - Autoscaling GPUs.
Speed: Working hours, night time check on documents.
Quality: metrics in eval.

Interaction Pattern:

Edge Cases:

Questions: Who are the users?
Employees: Are they familiar with usign AI tools? Do they use any tools in their usual work flow in the job?
1 employee, not familiar with AI tools.
Tools used: GMAIL, EXCEL, GOOGLE DRIVE FOR DOCUMENTS.

Current statistics: 15 customers onboarded /month , target to 30 customers/month

How many classes? Are they static? They are dynamic, not in scope.

How is data restricted? Agent-role of the employee, can access.

Does the bank send back fully informative documents? Employee fills form with info for banks. Employee fills rows of form based on document. Ex. total expense done in purchasing physical assets. 30-such questions. Static form for all banks, documents of clients might not contain information. Status, details.

Does dataflow need to remain in italy? Some need to remain (PII) in the EU.
GPUs? Some RTX600 but don't know how to use them.

Downtime? Work towards downtime coordination, not all the time onboarding. First week peak demand of the system.

Who evaluates the solution? 4-5 people manually do this, varies. Check if all steps have been followed.

Use AWS.

Problem? Missing documents?
Form submission does not start if documents missing. Problem: short attention spans, they might stop.
